

3.1 FINALIZATION OF CORRIDORS AND SELECTION OF SPECIFIC “SAMPLE” ROUTES FOR STUDY WITHIN CORRIDORS

OVERVIEW

This work element consisted of a review of the initial set of potentially viable corridors and routes, developed by the PMT in an earlier stage of this study, and a recommendation to move forward with specific sample corridors and routes with only minor variations in routing. After further review by the PMT, it was concluded that additional bus rapid transit routes should be included in Stage I analysis as well.

The following maps depict the sample routes used for Stage I ridership modeling. Each map represents the routes that were grouped together in the modeling process.
